Exercise 4.1: Measurement invariance between the WAIS and WAIS-IV

We read in the data:

```
WAIS.cor <- law matrix lower2full(c(
  1.00,
  0.31, 1.00,
  0.36, 0.40, 1.00,
  0.51, 0.46, 0.45, 1.00,
  0.29, 0.40, 0.33, 0.43, 1.00,
  0.39, 0.29, 0.27, 0.36, 0.33, 1.00,
 0.32, 0.27, 0.29, 0.33, 0.24, 0.28, 1.00,
 0.22, 0.32, 0.15, 0.22, 0.27, 0.12, 0.26, 1.00
))
WAIS.means \leftarrow c(7.83, 5.50, 5.67, 21.50, 7.67, 8.00, 6.50, 34.83)
WAIS.sds \leftarrow c(2.69, 1.50, 2.36, 6.06, 1.85, 2.18, 5.97, 9.94)
WAIS.cov <- cor2cov(WAIS.cor, sds=WAIS.sds)
WAISIV.cor <- lav_matrix_lower2full(c(
 1.00,
  0.46, 1.00,
  0.58, 0.55, 1.00,
  0.63, 0.43, 0.73, 1.00,
  0.27, 0.51, 0.37, 0.33, 1.00,
  0.45, 0.38, 0.37, 0.43, 0.13, 1.00,
  0.33, 0.52, 0.49, 0.41, 0.29, 0.43, 1.00,
  0.15, 0.27, 0.16, 0.09, 0.12, 0.25, 0.23, 1.00
))
WAISIV.means <- c(15.17, 15.00, 11.83, 21.67, 12.17, 17.83, 18.67, 45.83)
WAISIV.sds <- c(4.93, 4.10, 5.20, 6.54, 2.72, 5.35, 9.36, 10.44)
WAISIV.cov <- cor2cov(WAISIV.cor, sds=WAISIV.sds)
WAIS.names <- c("Compr", "Arith", "Simil", "Vocab", "DigSpan", "PictCompl",
                 "BlockDes", "Cod")
names(WAIS.means) <- names(WAIS.sds) <- colnames(WAIS.cov) <-</pre>
  rownames(WAIS.cov) <- names(WAISIV.means) <- names(WAISIV.sds) <-
  rownames(WAISIV.cov) <- colnames(WAISIV.cov) <- WAIS.names</pre>
WAIS.cov.list <- list(WAIS.cov, WAISIV.cov)
WAIS.mean.list <- list(WAIS.means, WAISIV.means)</pre>
WAIS.n.list <- list(WAIS.n = 200, WAISIV.n = 200)
```

```
WAIS.mod <- '
## verbal comprehension
VC =~ Simil + Vocab + Compr

## Perceptual reasoning
PR =~ PictCompl + BlockDes

## Working memory
WM =~ Arith + DigSpan + Cod</pre>
```

a) Considering that both WAIS versions were administered to the same respondents, one would expect their latent verbal comprehension, Perceptual Reasoning and Working Memory scores to be the same between tests. Thus, the latent means and variances can be expected to be equal. Therefore, the standardized LV approach seems the most appropriate for these data.

Note that when equality restrictions on parameters across groups are applied in a model identified using the standardized-LV approach in lavaan, the latent mean and variance will be fixed to 1 and 0, respectively, in the first group. In the second group, the loading and intercept of the first item will be fixed to the respective values in the first group, to identify the model. This allows for differences in the latent mean and variance to be present. For the current example, this may not be completely appropriate, but the current design (testing measurement invariance between two different tests in the same individuals) is quite rare.

b) We fit the configural invariance model to the datasets:

```
##
             lhs op
                           rhs group
                                          est
                                                   se pvalue std.all
## 1
              VC =~
                                        1.393
                                                0.170
                                                       0.000
                                                                0.592
                         Simil

```

Model fit is good according to SRMR and CFI. RMSEA indicates adequate fit. All standardized loadings are substantial in both versions, in both versions Coding is the weakest indicator. The strongest indicator is Vocabulary in the WAIS and Arithmetics in the WAIS-IV. The three factors correlate strongly in both groups, but more strongly in the WAIS than in the WAIS-IV group.

```

WAIS-IV has two residual correlations with absolute values larger than .1: the correlations of Picture Completion with Digit Span and Coding.

All in all, configural invariance appears tenable.

b) Assess whether loadings, intercepts and residual variances are equal between the two WAIS versions.

When we use the standardized LV identification method, and apply an equality restriction on the loadings between groups, lavaan will keep the latent variance of the first group fixed at one, but will freely estimate the latent variance in the second group.

```
group.equal = "loadings")
pars <- parameterestimates(WAIS.metr.fit, standardized = TRUE)
pars[pars$op == "=~" | pars$rhs %in% c("VC", "PR", "WM"), c(1:3, 5, 7, 14)]</pre>
```

```

```

Note that now the latent variance are freely estimated for the WAIS-IV, and are much larger than for the WAIS (where they are fixed to 1).

This may indicate that the measurement precision of the WAIS-IV is much higher than that of the WAIS. It cannot be due to latent differences between the two 'groups', because the two tests were administered to the same individuals.

```

Model fit improved, but not enough.
It may seem odd that we have three identical values for the six remaining modification indices. We lifted two
equality restrictions, one for the VC and one for the WM factor. For each latent factor, there are now two
equality restrictions left. Releasing any of the two will yield an identical improvement of model fit.
Next, we lift the equality restriction on the loading of Similarity:
WAIS.metr.fit3 <- cfa(WAIS.mod, sample.cov = WAIS.cov.list,
                      sample.mean = WAIS.mean.list,
                      sample.nobs = WAIS.n.list, std.lv = TRUE,
                      meanstructure = TRUE,
                      group.equal = "loadings",
                      group.partial = c("VC =~ Vocab", "WM =~ Arith",
                                          "VC =~ Simil"))

Fit is acceptable. We continue with testing equality of measurement error variances:
WAIS.uni.fit <- cfa(WAIS.mod, sample.cov = WAIS.cov.list,
                    sample.mean = WAIS.mean.list, std.lv = TRUE,
                    sample.nobs = WAIS.n.list, meanstructure = TRUE,
                    group.equal = c("loadings", "intercepts", "residuals"),
                    group.partial = c("VC =~ Vocab", "WM =~ Arith",
                                        "VC =~ Simil", "Vocab ~1",
                                        "Compr ~ 1", "PictCompl ~ 1"))
```

Warning in lav_model_estimate(lavmodel = lavmodel, lavpartable = lavpartable, :
lavaan WARNING: the optimizer warns that a solution has NOT been found!

We get a warning about negative LV variances, which indicates that restricting all measurement error variances to equality is not a good idea.

Considering the large number of non-invariant parameters, measurement invariance does not seem tenable. I would rather go back and inspect the parameter estimates of the configural invariant model:

```
pars <- parameterestimates(WAIS.conf.fit, standardized = TRUE)
col_names <- c("lhs", "op", "rhs", "group", "est", "se", "pvalue", "std.all")
pars[pars$op == "=~", col_names]</pre>
```

```

```

Standardized loadings are higher for the VC and PR indicators in the WAIS-IV, compared to the WAIS. For the WM indicators, we see that in the WAIS, the indicators have similar standardized loadings, while in the WAIS-IV, Airthmetics has a much higher (standardized) loading than the other two subtests.

```

```

We observe the reverse pattern for the residual variances: Standardized residual variances are higher for the VC and PR indicators in the WAIS, compared to the WAIS-IV. For the WM indicators, we see that in the WAIS, the indicators have more similar standardized residual variances, while in the WAIS-IV, Airthmetics has a much lower (standardized) loading than the other two subtests.

                                                      4.401
```

The intercepts seem lower for the WAIS than for the WAIS-IV, indicating that the the subtests of the WAIS-IV may be easier. Perhaps the tests have different numbers of items and different scoring rules. But the intercept differences should be interpreted relative to the indicator item.

```

We see stronger correlations between the latent factors in the WAIS, than in the WAIS-IV.

All in all, there does not seem to be measurement invariance between the WISC and the WISC-IV. Thus, observed subtest scores are not comparable between the two test versions. However, the results do indicate that the WAIS-IV is an improvement over the WAIS: It has better measurement precision, and the latent factors seem more separate traits than they were in the WAIS.
